How to adjust your Beamax screen to stop at the right position SOMFY MOTOR

WARNING - READ CAREFULLY BEFORE PERFORMING ADJUSTMENTS

Adjustments shown in the following table must be performed by authorized and specialized personnel only. Incorrect performance of the procedures described may result in damages to the product which will not be covered by guarantee. End stops adjustment varies depending on the motor's position (left or right side) and on drop of the curtain (back or front). Adjustment is performed with a 4 mm hex wrench.

END STOPS ADJUSTMENT SCREWS ARE POSITIONED IN THE BOTTOM PART OF THE SCREEN, AND NOT IN THE RIGHT OR LEFT HAND SIDES. DO NOT ADJUST THE END STOPS WHEN UP OR DOWN BUTTON IS ACTIVATED.

WARNING "UPPER END STOP MUST ALWAYS BE ADJUSTED AT 2mm FROM THE CASE.

End stop is adjusted to allow the projection sheet to wind around the roller at least 1.5 times to avoid the sheet coming loose. Special attention must be paid when end stops are adjusted in such a way that projection sheet unwinds beyond the factory setting. Incorrect adjustment of end stops can cause:

- -Projection sheet coming away from the roller
- -Projection sheet winding the wrong way, with ensuing damage to flatness of the projection surface and to winding mechanisms
- -Breaking of bottom end black frame welding (framed screens)
- -Excessive strain on motor with possible ensuing damage and activation of motor's thermal resistance
- -Excessive winding of the end stop adjustment system with ensuing breaking of the mechanical part

WARRANTY Operators are reminded that in cases where seals have been tampered with and where any damages have resulted from incorrect adjustment, repair interventions shall not be covered by guarantee.

How to adjust your Beamax screen to stop at the right position

*NEVER LOWER THE SCREEN MORE THAN INITIALLY SET BY THE FACTORY **UPPER END STOP MUST ALWAYS BE ADJUSTED AT 2 MM FROM THE CASE
